Editorial

Ambipar started a new era in its history. **Entry into B3**, the Brazilian stock exchange, symbolizes a milestone in its evolution. For years, the company had the ambition to go public and raise funds to make investments that would guarantee it to achieve the vision of becoming **a world leader in environmental management**.

For several years, Ambipar prepared for the ideal **moment of the IPO** (acronym for Initial Public Offering). Bet on offering environmental solutions aimed at the **recovery of waste** and **circular economy**, growing organically and inorganic, with acquisitions in Brazil and abroad, which allowed it to gain muscle to start its performance in B3 in a comfortable situation. At the same time, it structured the service portfolio based on the **ESG** (Environmental, Social, Governance) pillars. Today, there is a great appreciation of the shares of companies that practice the concepts of this index, as they present better results and the purchase of their shares is recommended by financial analysts to investors. This benefits Ambipar and shows that we are on the right path.

NEWS: Ambipar around the world

Equipment maintenance in Holland benefits the North Sea region

Ambipar performed the preventive maintenance of emergency response equipment with oil spills at the port of Rotterdam, in Holland. The company performs the service to serve a large customer in the largest port in Europe. In about four months, a number of offshore oil spill response equipment were received from other parts of the Port of Rotterdam, as well as from Italy and Finland to prepare all necessary documentation and logistical arrangements for the equipment to be used in eventual occurrences in the North Sea region.

Partnership with Portuguese company avoids Covid-19 proliferation

Ambipar entered into a successful partnership with a Portuguese services company specialized in installation and maintenance services.

With the partnership, the company starts offering Ambipar's environment disinfection services to customers. Ambipar Response performed the disinfection of the company's environments, in Algarve, Portugal and gave training last week. The aim is to help stem the proliferation of Covid-19.

NEWS: Ambipar pelo Mundo

Training and tests in the Netherlands have members of the European Union

UK Ambipar carried out training, health condition testing attendance equipment to oil spill and maintenance in Rotterdam, the Netherlands, in early September. The Ambipar team met with representatives from several European Union member states, including Dutch, German and Belgian authorities, who participated in the training. During Ambipar's stay in Holland, teams were on standby for offshore incidents in Venezuela and Sri Lanka.

Ambipar participates as "Special Expert" in committee in the USA

Ambipar participated in the Technical Committee NFPA 472, Chemical Emergencies and WMD in Orlando, Florida. Ambipar has been part of the committee since 2012 and is the only South American member with a nomination of "Special Expert". The aim is to prepare targeted standards for responding to chemical emergencies and weapons of mass destruction.

WITH AN EYE ON ESG:

Investors are attentive to companies that follow the pillars of sustainability

ESG (Environmental, Social and Corporate Governance) indexes are gaining more and more importance in the investment world. Although the term has existed for years, the discussion on the subject grew, mainly in 2020, due to the disclosure of a letter to shareholders, investors and partners made by Laurence Douglas Fink, CEO of American Black Rock, the largest consultancy in the world investment management. The influential Larry Fink argues that climate change directly affects the economy and recognizes that companies that experience an ESG posture obtain better financial results, reinforcing the importance of sustainable business. To this end, from now on, Black Rock will recommend actions by these organizations in the investment strategies they develop for their clients.

The world watched the statement carefully and the term ESG came up strongly. Investors began to pay attention to companies that practice the three pillars of sustainability. After

all, companies' sustainable practices reflect directly in the image before the market, consequently, this increases or decreases stock value.

Although the term ESG is in evidence now, Ambipar has started to incorporate the concept in its practices and services for about ten years. With the National Solid Waste Policy, the company concentrated its efforts on solutions in line with the concept of circular economy and knew that the theme would have great evolution in the future. According to Thiago Silva, Ambipar's Chief Financial Officer (CFO), the company turned entirely to the environmental sector, creating structure and expertise to enter the stock exchange at the time when sustainability became a hot topic.

Onara Lima
Sustainability Director

According to Ambipar's sustainability director, Onara Lima, interest in the circular economy reinforced the funds' commitment to looking at companies that practice ESG and materialize this performance. "Ambipar's IPO (Public Offering) came precisely to show the fund's interest and commitment to companies that practice ESG on a daily basis. The market is looking at companies that practice sustainability in a more judicious way and observing the chain as a whole brings new practices".

Ambipar is a precursor company in environmental management, which helps companies to meet ESG indices. Based on waste management and recovery services, Ambipar practices circular economy, promoting care for the environment.

With emergency response services, in addition to minimizing environmental impacts, actions avoid social problems for communities that may eventually be harmed due to accidents with chemicals. In terms of governance, Ambipar offers legal and environmental compliance software to help companies in this regard.

Since joining B3, the official stock exchange in Brazil, Ambipar has obtained, on average, 20% of share appreciation. The assessment is completely positive from the point of view of the company's CFO. "Our results are being very good. Even funds from abroad send requests to get to know Ambipar better and all its activities in the market", reinforces Silva.

Environmental

Sustainable actions to reduce environmental impacts and take care of the environment.

Waste management, circular economy, renewable energy, reduction of carbon emissions.

Social

Corporate social actions to assist institutions or communities and promotion of a healthy work environment.

Respect for labor laws, creation of policies that respect the rights of women and inclusion, mainly, in leadership positions. Work safety, incentive to volunteer work.

Governance

Administrative and governance actions carried out always following the code of conduct of companies and legislation.

Transparency, audits, independent boards of directors, legal and environmental compliance, efficient risk management, commitment to generating shareholder value.

VÁ DE ETANOL

In October, Ambipar launched the 'Vá de Etanol' campaign to raise public awareness of the benefits of filling the vehicle with alcohol. Within the company's good practice policies, ethanol is already mandatory for light vehicles to reduce emission of carbon dioxide into the atmosphere. The idea is that Ambipar employees also supply private vehicles with ethanol. The campaign caught the attention of Copersucar, which joined Ambipar, in order to publicize the action to everyone.

COPERSUCAR

The first step was to produce a stamp to paste in the fleets of the two companies, in order to encourage the use of ethanol instead of gasoline. "From the stickers, people start to see the action on the streets. It is a way of transmitting the message and raising awareness about the benefits of supplying with alcohol", says Onara Lima, Ambipar's director of sustainability.

RENEWABLE, CLEAN AND
SELF-SUSTAINABLE!

During the campaign, Ambipar and Copersucar will work on informative materials on the benefits of using ethanol. In a second stage, employees of both companies will be encouraged to use alcohol as a fuel. The objective is to spread the message so that customers, suppliers and partners also use this type of fuel.

Ethanol can reduce emissions of carbon dioxide from 70% to 90% in the atmosphere, according to data from the analysis of the life cycle of ethanol by plant and data from the Renovabio program, made through RenovaCalc. Ethane releases less carbon dioxide into the atmosphere because it is extracted from sugar cane, because during photosynthesis, plants absorb almost all the CO₂ in the atmosphere in fossil fuels, carbon dioxide extracted from the earth is released, causing the greenhouse effect, which contributes to climate change.

Sustainability actions

Ambipar is aligned with the pillars of the ESG index (environment, social and governance) and helps corporations to be more sustainable through the products and services offered. In order to continue to meet these sustainability guidelines, Ambipar carries out a series of internal actions, such as the implementation of solar panels to generate clean energy, in addition to a rainwater reuse system.

Data on ethanol:

Brazil is the largest sugar cane producer

In the 2019/2020 harvest, 642 million tons of sugar cane were processed, 65% of which went to ethanol production, generating 35 billion liters of alcohol.

Until May 2020, consumption of ethanol and the mixture of 27% anhydrous ethanol in gasoline reduced 515 million tons of carbon emissions into the atmosphere.

Benefits of using ethanol:

Reduces greenhouse gas (GHG) emissions

Contributes to generating jobs in Brazil

Decreases dependence on imported fossil fuel

Improves car engine performance

IPO: **Entry into B3** marks NEW ERA

Thiago Silva
CFO da Ambipar

Cristina Andriotti
CEO da Ambipar

Ambipar debuted at B3, Brazil's official stock exchange in Brazil, on July 13th. With the IPO, the company shows its consolidated structure and all the greatness acquired through organic and inorganic growth in recent years. Ambipar was launched on the stock exchange with **AMBP3** ticker negotiated at R\$24.75, at the top of the indicative range of initial public offer (IPO). On the day of the debut, the share price was closed with a growth of 18%.

Ambipar was the first environmental management company to join B3. According to Thiago Silva, Ambipar's Chief Financial Officer (CFO), the company differs from all others in the segment due to the variety of services offered. "There are competing companies on the market, but none of them is comparable to Ambipar, because we are the only ones that offer

emergency care and waste management and recovery", he explains.

Going public has always been a wish of Ambipar. In 2012, the company carried out the new corporate formation, becoming a holding company. However, it was still necessary to invest more in the growth of the company to reach the stock exchange. After the acquisition of several companies in South America, Europe, the United Kingdom and the USA, in addition to the organic growth in Brazil, Ambipar closed 2019 with an expressive business structure, appropriate to start the planning of insertion in B3.

With the IPO, Ambipar received capital to conquer the vision of being a global leader in environmental management. This will be done

through international market growth. Currently, the company is directing efforts to acquire companies with a core business in emergency care in the United States, to ensure emergency response throughout the North American territory. With the purchase of Intracoastal Environmental, One Stop Environmental Services and Allied International Emergency, this year, Ambipar will have emergency call bases in Texas, Alabama, Georgia and Florida.

In Brazil, the opening of new commercial and operational bases aims to reduce the response time to emergencies. Abroad, the idea is to continue with expansion through inorganic growth in the United States and European countries.

Environmental, Social and Corporate Governance (ESG)

Ambipar is a company aligned with the ESG pillars, which helps other companies to comply with the requirements of this index when offering environmental management services. With Ambipar's IPO, investors became aware of the possibility of investing in a totally sustainable company, which takes care of the environment and practices the circular economy. In addition, the increasing popularity of the ESG index favors Ambipar to increase its own range of customers precisely to be a leader in environmental management.

Ambipar buys three emergency response companies in the USA

Ambipar, a specialist in crisis management involving health, environment and wealth, acquired three North American companies specialized in emergency services. One Stop Environmental Services, Intracoastal Emergency Response and Allied International Emergency (AIE). The purpose of the initiatives is to expand the company's operations worldwide and is in line with the vision of being recognized as a global referendum on integrated environmental solutions.

As a result, Ambipar now has bases in Texas, Alabama, Georgia and Florida, capable of

offering services in all North American states. "The USA is among the largest and most important economies on the planet. We have a strong interest in growing and consolidating this market", says Guilherme Borlenghi, CEO of Ambipar Response.

The purchase of Allied International Emergency was made in early 2020, marking the entry of Ambipar's definitive presence in the American market. In early September, Ambipar further expanded its presence in the United States with the purchase of the two other companies.

Allied International Emergency (AIE)

AIE was founded in 2007 by Ty Mckee and has had great market growth since then. In 2008, the company acquired the environmental division of a major construction company, based in Dallas. In this way, Allied International Emergency significantly increased the range of production and equipment available to carry out the services. In 2012, AIE opened a branch in Midland, Texas, to serve the entire Permian Basin, including the far west of Texas and southern New Mexico.

One Stop Environmental (OSE)

One Stop Environmental (OSE) was founded in 1999 in Birmingham, Alabama. OSE was recently named the 487th fastest growing private company in the country (INC 500 list) and the 5th fastest growing urban center company (HubZone) in the country (ICIC 100).

Intracoastal Emergency Response

Intracoastal Emergency Response is a North American company specializing in emergency care. With a solid structure of proven policies, the mission is to provide customers with the highest standards of safety, manufacturing quality and reliability. The company keeps itself up to date with the sector's technologies and invests in equipment and in the training of employees to guarantee the efficiency of services.

Ambipar already has the capacity to serve the entire United States and continues to study new acquisition possibilities. "The market for emergency services is very fragmented in the country. There is no such thing as a company with national operations, only players with regional reach and who work focused on specific niches", explains Guilherme. "Our differential is the experience of 25 years, the quality of our services and the comprehensive performance in different modes (maritime, rail, road, river) and segments (industrial, natural disasters, mining, airport, among others)", he concludes.

For the Head of AIE, Ty Mckee, Ambipar and a company with a strong leadership team that has a great ambition to provide good quality services to customers. "Ambipar's standard management style and operating procedures will bring a great benefit is the expansion in the USA and the offer of the same level of service throughout the world", he says.

**#WEARE
#AMBIPAR**
Together we are stronger!

"We will focus on open communication with all our staff, developing specialized training on quality of service, as well as cross selling to our customers worldwide. These efforts will help employees to provide superior service to our growing customer base in all global offices, including South America, United Kingdom and United States", says Ty.

Environmental management technology?

Yes, we have too!

In October, Ambipar acquired 100% of the capital of Verde Ghaia. In July of this year, the company had already acquired Âmbito Negócios Sustentáveis. Both companies specialize in legal, risk and compliance monitoring systems with a focus on sustainability and traceability.

The initiative is part of Ambipar's efforts to offer complete ESG (Environment, Social and Governance) solutions to its customers. From the purchase, the company takes the lead in software and environmental management systems.

“We are going to combine the expertise of the two companies and offer robust service

Âmbito was founded in 1994, with the purpose of supporting business leaders in the formation of businesses that have seen ethics, human, economic, social and environmental values. The company offers consulting, auditing, training and technological solutions to help companies with sustainable management. Next, Âmbito's consulting director, Elaine Moreira, tells us a little about the company. She is graduated in law from the Centro Universitário Newton Paiva, specialist in civil law master in sustainability and has worked at the company for 16 years.

What is the focus of Âmbito's business today?

10 years ago, Âmbito started to work with legal and environmental management software, with a portfolio of systems related to legal requirements, transport and management of waste, treatment of non-conformities, document control, management of suppliers and third-party employees. In addition to the software already available, the company also acts in a personalized way, understanding the customer's need to create a specific environmental management system.

How do you evaluate the market?

In view of the pandemic scenario and the whole discussion around climate change, it is clear that companies are more concerned with meeting sustainability requirements. Investors are keeping an eye on companies that are ESG (Environmental, Social, Governance) and our software contributes to these indicators in all areas of social responsibility, environment and governance, so the market is heated.

How can software contribute to the social, environmental and corporate governance of other companies?

When we talk about a system to manage transportation and waste management, we are helping companies to take care of the environment. Our software for handling occurrences, non-compliances, in addition to the document control system for management, helps with the governance issue. All company actions are directly linked to compliance with legislation and with the technological systems of legal and environmental compliance we help companies in this sense.

support to our customers, using artificial intelligence applied to environmental processes”, says Thiago Silva, CFO and Ambipar Investor Relations director.

Using the legal and environmental compliance systems of the acquired companies, Ambipar will be able to map the requirements of the legislation for the market segment and make all the management of regulatory license

terms, control of the health and safety of employees, ensuring traceability, among other possibilities. In this way, Ambipar provides customer security to control deadlines, in order to offer legal interpretations so that they know how to act to meet specific requirements.

VG was founded in 1999 by Deivison Pedroza. Since then, the company has assumed the role of protagonist, integrating sustainability and innovation at the heart of its corporate strategy, in all operations, policies, products, processes, projects, initiatives and relationships. Today, the company is a leader in its field. Next, Pedroza speaks to AN Saber about history, business and the legal and environmental compliance software market.

What does VG do?

VG is the largest applicable legal compliance monitoring company in Brazil, which operates mainly in Risk Management and Sustainability Compliance services. Its motto is technology for the future of sustainability, offering more practical and faster solutions for customers. Combined with technology, we have expertise in personalized consultancy to achieve the best results in the areas of environment, health and safety, quality, food safety and social responsibility.

What solutions does VG offer?

Solutions based on artificial intelligence. One of the biggest highlights is SOGI, a Sustainability Management and Performance Software developed through its own methodology, an integrated, legal and strategic online management software. In order to streamline the processes for capturing and interpreting legislation in real time, the company has also developed LIA, the Artificial Intelligence platform capable of identifying financial risks and prioritizing all legislation applicable to any industry, offering safe responses on environmental compliance and occupational health and safety.

How is the market in this area?

This is the best time. This year, the market has completely turned its attention to the theme of sustainability due to the ESG (Environmental, Social, Governance) which is on the rise and companies are looking for solutions to align themselves with its pillars and meet the best indicators related to the theme. Finally, investors realized that solid companies must have a long-term vision and be in accordance with sustainability indicators, which is essential for this.

CORONAVIRUS SPECIAL

#togetheragainstthecovid19

ambipar.com

Disinfection services help contain Coronavirus in the UK

Governments, companies and the entire population come together to stop the Coronavirus outbreak (Covid-19) in the world. Ambipar has carried out a series of preventive actions to Covid-19. The United Kingdom's Department of Health and Social Assistance hired Ambipar to assist disinfection of the **WAMOS aircraft**, used to evacuate around 200 British citizens and foreigners from Wuhan on the chartered flight to the King in the United Kingdom in mid-February.

The aircraft's clinical waste was removed, packed in lined containers and disposed of by agreed and licensed routes. The Ambipar team and the Dangerous Goods Security Advisor (DGSA) worked in collaboration with various British government entities.

Ambipar also disinfected all buses used during the transfer of British citizens to Milton Keynes. Twelve wagons were disinfected through two-stage processes on all soft surfaces. Before returning the goods to the operators, Ambipar analyzed and observed the wagons for six hours to certify the efficiency of the operation.

As a company specialized in emergency care and viral crisis management, Ambipar performs disinfection services for environments at national and international levels. In this way, trained professionals were able to support the UK government's response to the ongoing incident.

US companies hire environment disinfection services

Ambipar performed disinfection services for companies in Houston and Dallas, in the United States. Disinfections were carried out as a way of preventing the new Coronavirus (Covid-19). In order for the services to be totally efficient, the Ambipar USA's management team drew up a document with guidelines from North American, South American and United Kingdom disinfection protocols.

Ambipar's team used specific equipment, such as hydrostatic spray, electrostatic nebulizers and manual cleaning on high-contact surfaces. Products used include quaternary ammonia,

bleach and isopropyl alcohol to ensure the elimination of viruses, fungi and bacteria present in the environments.

Only specialized companies and fully trained professionals carry out services of this type effectively. There are methods and products that can cause damage and damage to the environment, precisely due to the lack of knowledge, experience and training of company.

“Currently, essential services are seeking disinfection when one of their collaborators counterfeit the virus or had contact with someone infected. We are providing that companies may opt for the service more frequently when the quarantine ends, as a precaution for employees who will go back to work”

Ty Mckee, head of Ambipar TX

In times of pandemic, prevention is the most efficient measure

Covid-19 has a layer of fat that protects it from temperature and gives it grip. During the disinfection of environments, technical experts use specific products based on ammonia. The substance is a strong industrial disinfectant able to break down the outer fat layer of the virus and thus render it inert.

According to Ambipar Response's operations superintendent, Everaldo Savatin, if a person with Covid-19 has contact with the location or

or vehicle, disinfection of environments is an efficient measure to end the virus and keep the rest of the people who use the site protected. "It is important that all companies in all sectors perform the disinfection of the workplace as it is an action of great importance in fighting the virus and, in doing so, the likelihood of proliferation decreases", says Savatin.

Even with the pandemic and social isolation decrees, there are sectors of society that cannot stop. The so-called essential services include supermarkets, pharmacies, bakeries, carriers of products and supplies, in addition to some restaurants that still work making deliveries. To prevent customers and employees from becoming contaminated, decontamination can be an ally.

The procedure is simple, but it cannot be done for anyone. It is necessary that a specialized technical team carry out the action efficiently, using all Individual Protection Equipment (EPis) and specific products. The technicians apply the products with sprinklers and costal

pump and they are spread with specific cloths. After application, the environment can be isolated until six hours or to pass through an exhaust system to expedite the release.

The product used in disinfecting environments is authorized and indicated by the National Health Surveillance Agency (Anvisa), therefore, does not cause environmental damage. It is only necessary to isolate the place for a few hours. All residues from disinfection of environments are treated correctly, in order to avoid environmental degradation.

Ambipar is a company specialized in emergency care and viral crisis management at national and international levels. During the pandemic, Ambipar provided disinfection services for several companies, supermarkets, stores, health units and a school in São Paulo.

Disinfectant protects surfaces for 24 hours against new Coronavirus

Ambipar has developed, in its Research, Development and Innovation laboratory (RD&I), **Ambiclean, a disinfectant capable of combating the new Coronavirus (Covid-19).** The efficiency of the product was tested and proven by the Institute of Biology at the Universidade Estadual de Campinas (Unicamp). Ambiclean® is composed of nano particles and reagents capable of inactivating Covid-19 and other viruses present in the environment and on surfaces.

During the studies carried out by Unicamp, the Coronavirus was inserted in environments and distinct surfaces. After contact, the product was sprayed on site to test the efficiency in different time periods. Research has shown that, over time, Ambiclean® increases the

virus inactivation capacity and the disinfectant is capable to eliminate it in any environment on the surface. The disinfecting effect stays for more than 24 hours on site, ensuring protection, even with the presence of contaminated people.

The product was developed and created by Gabriel Estevam Domingos, director of RD&I at Ambipar. For him, with Ambiclean®, the place is efficiently protected and, demonstrated, it is not necessary to perform disinfection procedures again in less than 24 hours. Ambipar is already producing Ambiclean® on a large scale to offer to the market. It can be used on any surface in the environment, it does not stain and has no smell.

We have achieved Together for Sustainability (TFS) certification!

Ambipar achieved the Together for Sustainability (TFS) certification with 100% acceptance for complying with all the standards and requirements established in the audit. TFS is a face-to-face assessment of a company's business units and practices. Participation occurs based on the indication of one or more members of the sectorial audit initiative.

The parameters of quality, environment, health, safety and social responsibility were analyzed. Ambipar has achieved 100% compliance with the requirements of the standard, carrying out its activities with excellence.

Employees' service period, working conditions, satisfaction with company policies and benefits received were evaluated. The report points to Ambipar's SASSMAQ certificate and to meetings on environmental management,

safety and also to social codes of the company that determine responsibility, safety at work, ways to avoid conflict of interest, bribery and forced labor.

The entire integration part was evaluated to verify that the code of ethics and conduct is being informed to employees, in addition to issues of safety, health and company values.

For Raísa Abdalla, Quality, Safety, Environment and Health manager at Ambipar, a certification, in any standard, especially TFS, represents the business organization, with mapped processes, defined organizational context, laws met in all spheres, such as social responsibility, environment and safety. "In this way, we achieve added value for the company and systematic improvements for employees", she says.

In a national campaign, Ambipar positions itself as a **leader in environmental management**

Ambipar started an unprecedented institutional campaign, nationwide, in order to position itself as a leader in environmental management in the Brazilian market. The initiative aims to make the company known throughout the country and a reference in the segments in which it operates.

The campaign includes three phases. The first, in October, published advertisements in major communication vehicles such as Valor Econômico, Folha de São Paulo and Estado de São Paulo and focused on the ESG index (Environment, Society, and Governance), which has directed the business of large companies and is at the center of the services that Ambipar offers to its customers. In addition to the inclusion in the press guidelines, in order to disseminate all expertise and know-how.

In the sequence, advertisements will be shown in the most important communication vehicles, created to generate impact and empathy in the whole society. The theme is a surprise. Wait! And, in the third and last wave, the company's products and

services will be explored.

The movement to position and promote the Ambipar brand is in line with the new phase of the company, which went public in July 2020. When an organization begins to trade its shares on the stock exchange, there is a need for it to communicate more with external audiences, taking a transparent stance on its financial health, business practices and operations. In this way, the company becomes more attractive to investors and interested in acquiring its shares.

This communication is also very positive, because it exposes Ambipar to society in general, which will get to know the company and everything it does in environmental management and emergency services.

Ambipar has a great structure for the management and recovery of waste in Brazil, in addition to emergency assistance with rapid response through 150 bases spread across 15 countries. In addition,

the company has more than ten patents for ecological products developed from waste, more than 29 awards in the area of Research, Development and Innovation (RD&I) and serves market-leading customers.

New Institutional Website

www.ambipar.com has a new look. Our institutional website has been completely modernized and the new design follows the visual identity developed for the campaign. Navigation has also been reformulated, it has become more intuitive and the themes are organized so that the user can find what they are looking for easily and quickly. Ambipar's virtual address is available in Portuguese, English and Spanish.

"We always work with excellence in the markets in which we operate. Now, it's time to tell Brazil everything Ambipar does and how it can help companies and the country to be more sustainable."

Ricardo Moreira
Marketing Director at Ambipar

DID YOU KNOW?

Waste from the fishing industry becomes feed in our laboratory

Ambipar's Research, Development and Innovation (RD&I) Department develops products from industrial and business waste. When a customer has problems with regard to proper destination, needs to reduce costs, follow laws and be more sustainable, the RD&I conducts research and studies to reuse materials and make them return to the production chain.

One of the technologies developed by Gabriel Estevam Domingos, director of RD&I at Ambipar, was dog and cat food. They were produced from remains of shrimp. "The creation process was due to the problem of residues, which are dumped directly into the bodies of water in the region of Guarujá/SP, causing serious problems of contamination and water transmission. As our role is to create technologies for the recovery of waste, we have developed a flour from these high added value tailings for the production of pet food", he says.

The product complies with the National Solid Waste Policy and is made from an ecological process designed to respect and help the environment. Several tests and studies were carried out to verify the functionality of the feed for dogs and cats. The results were totally positive.

The diets are highly nutritious, since the head and shell of the shrimp are rich in important nutrients for the health of the animal, such as calcium, magnesium, zinc, iron, aluminum, sodium and potassium. "The product follows a favorable and promising market. Rations can be widely accepted" says the director.

The production of feed from recycled material is done at low costs. Ambipar has the ability to offer the consumer public an additional option to the counterpart market, which, unlike conventional products, offers numerous benefits to users.

Ambipar develops sustainable soap from waste

Collagen used in medicine capsules was taken to landfill and can now be used as raw material for other industries

Ambipar's Research, Development and Innovation (RD&I) department developed a sustainable soap based on collagen, a fibrillar protein present in the human body responsible for skin elasticity. The by-product comes from leftover capsules for vitamins, oils and some medicines from the pharmaceutical industry and was destined for landfills. The soap was developed as a prototype to show the pharmaceutical industry the technical and economic viability of this new form of reuse of collagen, in order to reintroduce it into the production chain, being possible to give it the correct destination and promote the circular economy. The product has been dermatologically tested and approved.

Several studies have been carried out to understand how to correctly dispose of collagen. The team that worked on the project, led by the director of RD&I, Gabriel Estevam

Domingos, found that residua is an excellent raw material for the cosmetics industry, which can rarely use collagen to make sustainable products, such as soap, for example.

Based on the innovation developed by Ambipar, the pharmaceutical industries would no longer have expenses with the disposal of waste to landfills and would be able to generate revenue, selling collagen as a raw material to other industries.

"When starting waste as a raw material to produce cosmetics, companies align themselves with the ESG (Environmental, Social, Governance) pillars, as they will be reintroducing collagen in the production chain, creating sustainable products that can add the image of companies, says Gabriel.

➤ IN HOUSE TESTING

Ambipar produced about 300 sustainable soaps that were distributed to employees at the Nova Odessa operational complex.

The employee Igor Guilherme de Macedo, administrative assistant at Ambipar, was presented with the soap and says that "it is a very good innovation for the company mainly to achieve the 17 sustainable goals of the UN".

For the commercial analyst Davi Kendi, the idea is legal to be a way to stop throwing waste in landfills and start reusing and giving it useful life.

In its RD&I laboratory, Ambipar develops various products from waste. The aim is to reintroduce them to the production chain to promote the circular economy and reduce the amount of waste in landfills.

“Jogue Limpo” operates in the reverse logistics of lubricating oil packaging

The institute ‘Jogue Limpo’ performs the reverse logistics of plastic lubricating oil packaging to promote circular economy. The beginning of its operations was in 2005, in the state of Rio Grande do Sul, based on a demand from the local environmental agency. The system has been operating in Brazil, therefore, since before the National Solid Waste Policy (PNRS). In the year of the promulgation of the law, it was already present in Paraná, Rio de Janeiro, Santa Catarina, in the city of São Paulo, in addition to the pioneer state, Rio Grande do Sul. Currently, the system is available in more than 4 thousand municipalities in 18 states and the Federal District.

Ambipar is a logistics operator hired by ‘Jogue Limpo’ to serve the capital of São Paulo and the state of Rio de Janeiro. The entire system is monitored, allowing for tracking of routes and information on the weight of the plastic

received at the registered generating points. This information is transmitted in real time to the system’s website through the QR Code reading available on each truck.

At the plants, the packages are drained, undergo a process of separating the types of plastic, are crushed and sent to recyclers, who use the material to manufacture new products. Thus, it is possible to reinsert the waste in the production chain.

The priority of the system and **recycling to promote the circular economy**. However, it adequately treats all other waste received or collected, with the proper destination, enabling the transformation into industrial input. The legal obligation to carry out reverse logistics is performed with excellence on behalf of the associated companies.

We signed the **UN Global Compact**

Ambipar has just joined the select group of **signatory companies of the United Nations (UN) Global Compact**, the largest corporate sustainability initiative in the world. With the inclusion of the company in the Brazilian chapter, its public commitment to join efforts to achieve the “17 Sustainable Development Goals” becomes official, following the “Ten Universal Principles” linked to them.

“Adherence to the Global Compact is an important achievement, as it means one more step that we take in order to seek total alignment with values related to socio-environmental development and reinforces our commitment in this regard”, says Onara Lima, Sustainability director.

The Global Compact is an alignment between more than **15 thousand companies** that seek to adapt strategies, practices and processes to

these drivers in the areas of human rights, labor, the environment and anti-corruption.

Ambipar has the concept of sustainability in its DNA. It is a precursor in environmental management and helps companies to adopt sustainable practices and meet ESG criteria (Environmental, Social, Governance). Based on waste management and recovery services, the company practices circular economy in order to **promote the regeneration of the environment.**

At the same time, it offers emergency response services, which, in addition to minimizing environmental impacts, avoid social problems for communities that may eventually be harmed due to accidents with chemical products. On the governance front, it uses artificial intelligence to carry out legal monitoring, risks and compliance with a focus on sustainability and traceability.

Ethics and Social Responsibility in the corporate world

These are the two main values that guide the work of the Ethos Institute, to which Ambipar joined in October. This is an important movement for the company, as it symbolizes yet another commitment that we assume to be a company that acts oriented towards ethical principles and socially responsible practices.

As part of Ethos, we are joining more than 500 companies that are committed to promoting a more just and sustainable society. The institute is at the forefront of discussions about the challenges that sustainable development poses to us.

“This partnership will be very rich from the point of view of exchanging experiences. We have a lot to share about sustainability, as it is part of our essence. On the other hand, we will also have the opportunity to know what many recognized companies in this area have accomplished”, says Onara Lima, Sustainability director and Ambipar representative at the Institute.

About Ethos:

The Ethos Institute for Business and Social Responsibility is an OSCIP (Civil Society Organization of Public Interest) whose mission is to mobilize, raise awareness and help companies manage their business in a socially responsible way, making them partners in building a just society.

Created in 1998 by a group of businessmen and executives from the private sector, the Ethos Institute is a hub for organizing knowledge, exchanging experiences and developing tools to help companies analyze their management practices and deepen their commitment to social responsibility and sustainable development.

Charter of Principles: When we become Ethos associates, we assume the following principles that should guide our business and practices:

- ◆ Primacy of ethics
- ◆ Social responsibility
- ◆ Trust
- ◆ Integrity
- ◆ Dialogue with stakeholders
- ◆ Transparency
- ◆ Responsible marketing
- ◆ Interdependence
- ◆ Learning community
- ◆ Valuing diversity and combating discrimination

Oksigeno Institute promotes sustainability through environmental education

The Oksigeno Institute is a non-profit organization of Civil Society of Public Interest (OSCIP). It was created by Verde Ghaia, in 2006, with a commitment to get involved with global environmental causes and promote sustainability. In 2020, from the acquisition of Verde Ghaia, the institute becomes part of Ambipar's structure.

The work is focused on the elaboration and execution of socio-environmental programs promoted through education, be it through awareness raising projects in schools or the carrying out of inventories with actions to reduce greenhouse gases and carbon offset, aiming to mitigate the problem of climate change.

The institute develops solutions for companies that wish to carry out community work of environmental education. Each project is designed according to the needs and objectives of the company. Initially, a social and environmental diagnosis is carried out, mediation with the public interest, program development and execution. At the end of the activities, the Oksigeno team prepares results reports with evidence of the positive actions.

Awareness can be achieved through lectures and training with the client's employees, production of teaching materials such as books, magazines, handouts, posters or pamphlets. Also through theaters, competitions, fairs, seminars and events it is possible to transmit information on sustainability and the environment. In addition to these actions, Oksigeno offers distance learning courses to train teachers to be multipliers of knowledge.

Companies and carriers need to adapt to the new Mining Law

The companies and carriers of dangerous products are subject to assessment from the changes in standards and legislation. The new Law of the State of Minas Gerais establishes important obligations for carrying out transportation correctly.

With the new law, the transporters of dangerous products are obliged to maintain an active contract with companies that provide emergency assistance, on duty 24 hours a day. In addition, they need an Emergency Plan (PAE) prepared according to technical standards and always have the simplified document inside the vehicle. The contracted emergency company needs to register the emergency care service with the Secretariat of the Environment (SEMAD).

Ambipar helps companies and carriers to comply with the new Mining Law. The PAE is prepared by the technical department

according to the client's needs and in compliance with all rules and legislation. The emergency response team is available 24 hours a day, with a call center on duty around the clock and provides stickers for the fleet in accordance with the requirements of the standard.

Ambipar provides a certificate that proves that the customer has an active contract with an emergency company. The companies that hire the services receive advice to obtain the license for transporting dangerous products.

With the largest number of service bases spread throughout Brazil, Ambipar guarantees fast response time with a multidisciplinary and highly qualified team, state-of-the-art technological equipment. In the state of Minas Gerais alone, there are 19 service bases spread out to guarantee the standard of service.

150 own bases that guarantee the service standard throughout the world.

Our Integrated Training Center is highlighted throughout Latin America

Ambipar's Integrated Training Center introduced the theme of hazardous materials in the emergency care training market, with fully qualified instructors and international experience. The center is the most distinguished in Latin America. In addition, Ambipar offers courses on working in confined spaces, at height, fire fighting and rescue of victims. There are several trainings to train responsible and fully efficient professionals

According to Jorge Guidobono, responsible for the Integrated Training Center, Ambipar differentiates itself because people are trained in the practical aspects of controlling chemical emergencies, combining classroom and field activities. The emergency scenarios are always made in real size, using Ambipar's work procedures, the latest equipment and, in some courses, the practices are carried out with real products.

"We try to pass on to the professionals, who attend our Training Center, the spirit that everyone who wants to get involved in emergencies with hazardous materials must understand that they make a very important commitment. They need to

have responsibility to act and always prioritize safety and care for themselves and the environment", says Guidobono.

The duration of the courses can be four, eight or 40 hours. However, the challenge for this year will be to implement, through the distance learning platform, the theoretical training of the different courses, so that people can take full advantage when they are in the training field.

The demands in the field of training will be progressive and will increase according to the different levels, so that trainees can know their limit and improve performance. Training takes place during the day or night, even with adverse weather conditions: rain, intense heat, wind and cold. "We will give priority to the use of digital systems, so that students have cutting-edge teaching elements", reinforces Guidobono.

These courses will last 80 and 120 hours with instructors from Argentina, Chile, United States, Peru and Venezuela. All with extensive experience in chemical emergencies and university education.

Structure

The structure of Ambipar's Integrated Training Center is composed of ample space and various equipment that allows the simulation of emergency situations. The most relevant scenarios that the field has are: Transfer of liquids, transfer of compressed liquid gases that allow to do: open or closed circuits, with pumps, compressor or both, burning of gas, whether liquid or not, Hot tapping, neutralization of gases or vapors. For the simulations, the center has an industrial installation, a mooring pond, a supply section with Boeing A320 aircraft and a

road. In addition to scenarios with live chemicals, including chlorine, ammonia and cryogenics.

There are two operational vehicles: one for liquids and one for gases, with different types of combos, compressors, generators, grounding equipment, monitoring, sampling and all the necessary accessories to provide an adequate response. The entire structure was designed and created to ensure the best training on the market for emergency care professionals.

"In this way, we generate a training offer through which the trainee is equipped with essential tools and knowledge to put into practice what has been learned."

Jorge Guidobono

Donations are made to help institutions during the pandemic

The new Coronavirus (Covid-19) pandemic brought a number of challenges. With reduced salaries, layoffs and the economic crisis that reaching the whole society, many people in social vulnerability needed, even more, assistance. In addition, public health professionals had to work with the lack of supplies and the increase in patients seeking care.

In view of this scenario, Ambipar made a series of donations to help public agencies and health professionals. The Casa da Criança [Children's House] of Santa Bárbara d'Oeste received 80 food staples on June 14.

One hundred food staples were donated to the Clube da Melhor Idade [Club of the Best Age] of the Social Solidarity Fund of Nova Odessa, on April 14th. Another 100 were sent to the same

institution on September 3. The first lady, Andrea Pereira Silva Souza expressed gratitude to Ambipar for the initiative in the midst of the pandemic.

"This is a moment of gratitude. Joy for the solidarity and sadness for the scenario that we are facing. We are happy with the actions that have been taken to help people in need", says Andrea.

Between April 22nd and 24th, Ambipar supplied Samu of Americana with 100 overalls, in addition to 50 overalls for Santa Casa de Piracicaba and another 50 for the Americana and Santa Bárbara d'Oeste Fire Department. The municipality of Nova Odessa received 50 overalls on May 4 to supply public health workers.

The Nova Odessa Voluntary Fire Brigade received five approach clothes for firefighting on 24 July. This type of personal protective equipment (PPE) is essential for emergency care. Institutions are suffering from lack of PPE and thanked Ambipar for its solidarity action.

Outside the Metropolitan Region of Campinas (RMC), Ambipar donated 50 waterproof overalls to the Health Department of Barra dos Coqueiros, in Sergipe, on July 22. In addition, Ambipar donated 13 chairs and an air conditioner to Samu of Suzano on October 16.

On April 8, a mechanical fan was donated to the health department of Nova Odessa. The device is being used to serve patients from the public health system municipality's health. Ambipar also disinfected environments at the Hospital and Maternity Doctor Acílio Carreon Garcia, from UBS V and from city squares, free of charge.

The purpose of the actions is to assist poor communities, public agencies and health professionals who face the lack of inputs in the midst of the pandemic.

Padrinho program intends to reduce accident rate

A study by Ambipar's Corporate Security department in 2017 revealed that the cause of most work incidents is due to a lack of knowledge of safety rules and regulations. Therefore, employee turnover in client companies was high. In order to reduce the number of accidents, Ambipar launched the Padrinho Program in order to instruct and monitor the development of new employees and enable them to perform safe work.

One of Ambipar's client companies that joined the Padrinho Program saw a total decrease in work incidents. The employee starts to better understand the company operation, how to act, behave, what are the safety rules and what to do to avoid incidents. Thus, there was a reduction in problems and expenses for the client company.

"This program benefits the company in terms of safety in the operation, reducing the rates of

accidents at work, bringing quality to the new workforce and conserving lives. This is our greatest asset. The program's motto is to take care to be taken care of", says Clemer Lopes, supervisor of Ambipar's Occupational Health and Safety department.

In this initiative, Ambipar's employees are sponsored by a staff member, who will teach them all duties of the function, assess the attention and knowledge that the new employee is having during the performance of activities. Finally, an assessment is made of the skill of the employee in training.

In addition to learning about the company's services and operations, the employee understands the safety rules, rules and actions that must be taken in certain situations. Ambipar's role is to encourage units to join the program, which is a mandatory item for new employees to start.

WE ARE PREPARATION

AMBIPAR RESPONSE'S TRAINING THE BEST ON THE MARKET

Ambipar Response has the most differentiated Integrated Training Center on the market. We have several equipment to simulate emergency situations so that professionals learn in practice.

**OUR PROFESSIONALS ARE TOTALLY SPECIALIZED AND
HAVE BEEN TRAINED IN VARIOUS COUNTRIES OF THE WORLD.**

- Theoretical and practical knowledge
- Complete structure
- Emergency simulations with specialized staff
- Guaranteed learning and training
